Pharmaceutical amides, and preparation, formulations and use thereof.

Compounds of the general formula

(wherein X is a group capable of functioning as a ligand for a zinc ion;

Ph is a phenyl group which is optionally substituted by one or more substituents selected from halo and nitro radicals;

Y is a group of formula:

where

R¹ is hydrogen or methyl;

R² is alkyl of 1 to 3 carbon atoms or is methylthiomethyl;

and

Z is a group of formula -OR³ or -NR⁴R⁵ where R³, R⁴ and R⁵ are each hydrogen or alkyl of 1 to 4 carbon atoms

and R³ can further be phenylalkyl having 1 to 3 carbon atoms in the alkylene moiety thereof, or phenyl) and pharmacologically acceptable basic salts thereof. These compounds have an advantageous enkephalinase inhibitory activity which renders the compounds of use in medical therapy for example when it is desired to prolong and/or potentiate in a mammal the effects of enkephalins of either endogenous or exogenous origin including in the later case synthetic enkephalin analogues.

Pharmaceutical amides, and preparation,
formulations and use thereof

This invention relates to amides and their preparation, to pharmaceutical formulations containing such compounds and the preparation of such formulations, to the use of such compounds in human and veterinary medicine, and to intermediates of value in the preparation of the amides and the preparation of such intermediates.

In 1975, Hughes et al. (Nature Vol. 258, December 18, 1975 pages 577 to 579) identified two related pentapeptides from the mammalian brain with potent opiate agonist activity, the enkephalins:

H.Tyr.Gly.Gly.Phe.Met.OH (Met⁵-enkephalin)

H.Tyr.Gly.Gly.Phe.Leu.OH (Leu⁵-enkephalin)

(The abbreviations used herein for amino acids and their radicals are those conventional in the art and may be found in, for example, Biochemical Journal

A621

15 H-Tyr.Gly.Gly.Phe.^{Met}Leu.OH
and thus generating the biologically inactive N-terminal
tripeptide fragment

H.Tyr.Gly.Gly.OH

Enkephalinase thus has a role in some ways com-
parable with that of the mammalian angiotensin con-
verting enzyme (ACE, EC 3.4.15.1) which acts upon the
relatively inactive decapeptide angiotensin I

H.Asp.Arg.Val.Tyr.^{Val}_{Ile}.His.Pro.Phe.OH
although it has been demonstrated (Swerts et al.,

European Journal of Pharmacology Vol.57 (1979) pages 279 to 281) that the two enzymes are distinct species.

Controlling the liberation of angiotensin II from angiotensin I, by selectively inhibiting ACE, has for some time been regarded as a possible method for the therapy of hypertension and a number of agents, originating from such an approach and exhibiting the desired properties, have been described. One especially potent compound is 1-(D-3-mercapto-2-methylpropanoyl)-L-proline (R,S), otherwise known as captopril or SQ 14 225 and having the structure

This has been reported as capable of inhibiting both enkephalinase and ACE (Swerts et al., loc. cit.) but as having a far greater specificity for the latter enzyme than for the former, the concentration of compound required to inhibit ACE by 50% being approximately 1000-fold lower than that required to effect the same degree of inhibition of enkephalinase.

The present invention relates to a class of compounds which have not only an advantageous enkephalinase inhibitory activity but also, in distinction to SQ 14 225, a greater specificity for enkephalinase than for ACE.

The present invention thus provides the amides

of formula (I)

together with basic salts thereof (i.e. salts formed by reaction of a compound of formula (I) with a base), wherein

X is a group capable of functioning as a ligand
5 for a zinc ion;

Ph is a phenyl group which is optionally substituted by one or more substituents selected from halo (i.e. fluoro, chloro, bromo or iodo) and nitro;

Y is a group of formula:-

10 where

R^1 is hydrogen or methyl;

R^2 is alkyl of 1 to 3 carbon atoms or is methylthiomethyl; and

Z is $-\text{OR}^3$ or $-\text{NR}^4\text{R}^5$ where R^3 , R^4 and R^5 are each
15 hydrogen or alkyl of 1 to 4 carbon atoms and R^3 can further be phenylalkyl having 1 to 3 carbon atoms in the alkylene moiety thereof or phenyl.

Formula (I) as above defined includes a plurality of asymmetric centres and should be understood to
20 include all optical isomers embraced thereby and mixtures thereof.

Suitable identities for the group X include
 alkanylthio having 2 to 5 carbon atoms, benzoylthio,
 phenylalkanoylthio having 1 to 3 carbon atoms in the
 alkylene moiety thereof, carboxyl, formyl, hydroxy-
 5 amino, mercapto, phosphono and (SH)monothiophosphono,
 i.e. OH(SH).O.P-.

In the salts of the amides of formula (I) the
 pharmacological activity resides in the amide (acid)
 anion and the identity of the cation is of less impor-
 10 tance although for therapeutic purposes it is prefer-
 ably pharmacologically and pharmaceutically acceptable
 to the recipient. Acceptable salts include ammonium
 salts, alkali metal salts such as sodium and potassium
 salts, alkaline earth metal salts such as magnesium
 15 and calcium salts, and salts of organic bases, for
 example amine salts derived from mono-, di- or triower
 alkylamines or cycloalkylamines such as dicyclohexylamine
 or alkanolamines such triethanolamine and diethylamino-
 ethylamine and salts with heterocyclic amines such as
 20 piperidine, pyridine, piperazine and morpholine.

As subclasses of the amides of formula (I) may be
 mentioned those compounds wherein

- (i) X is carboxy, alkanoylthio (for example acetylthio)
 or mercapto;
- 25 (ii) Ph is unsubstituted phenyl;

(iii) Y is a group (in either the D- or L-configuration) of formula:-

(iv) Z is -OH or -NH₂.

The amides of formula (I) and their basic salts
5 may be prepared by any of the methods known in the art
for the preparation of compounds of analogous structure.
Thus they may be prepared by reacting a reagent (II)
with a reagent (III)

wherein

10 Ph and Y are as defined in formula (I);

X¹ is a group X as defined in formula (I) or a
functionally protected derivative thereof;

Z¹ is a group Z as defined in formula (I) or a
functionally protected derivative thereof;

15 Q is carboxyl or a functionally activated deriva-
tive thereof; and

Q¹ and Q² are both hydrogen or together form a
bond;

followed (when Q¹ and Q² together form a bond)

20 by selective reduction of the said bond and, as appropriate, by depro-
tection of the product and conversion of the product
into the amide or a basic salt thereof.

The reaction of (II) with (III) may be effected using techniques standard in peptide chemistry and using either classical methods of peptide synthesis or solid phase procedures. Details of suitable activating and protecting groups and of suitable reaction conditions (both for the reaction of (II) with (III) and for the removal of protecting groups) may be found in the following literature which is given purely by way of exemplification and which is intended to be neither exhaustive nor limiting:

- a) Schröder and Lüebke, "The Peptides" (Academic Press) (1965).
- b) Belleau and Malek, J.Am.Chem.Soc., 90, 165 (1968).
- c) Tilak, Tetrahedron Letters, 849 (1970).
- d) Beyerman, Helv.Chim. Acta., 56, 1729 (1973).
- e) Stewart and Young, "Solid Phase Peptide Synthesis" (W.H. Freeman and Co.) (1969).

Certain of the amides of formula (I) may also be prepared from precursors which are themselves within formula (I).

Thus,

- (i) compounds wherein Z is $-OR^3$ where R^3 is hydrogen may be prepared by hydrolysis of corresponding compounds where R^3 is alkyl, phenylalkyl or phenyl;

(ii) compounds wherein Z is $-OR^3$ where R^3 is alkyl, phenylalkyl or phenyl may be prepared by esterification of the corresponding compound where R^3 is hydrogen;

5 (iii) compounds wherein Z is $-NR^4R^5$ may be prepared by reaction of a corresponding compound wherein Z is $-OR^3$ where R^3 is alkyl, phenylalkyl or phenyl with as appropriate ammonia or a mono- or dialkylamine;

(iv) compounds wherein X is mercapto may be prepared
10 from corresponding compounds wherein X is alkanoylthio, benzoylthio or phenylalkanoylthio by treatment with an agent such as methanolic ammonia solution.

The amides of formula (I) may be converted into basic salts thereof, and the converse, by well estab-
15 lished techniques.

In the preparation of certain of the amides of formula (I) and basic salts thereof wherein X is carboxyl a convenient reagent (II) is a D-(+)-2-benzyl-3-carbethoxypropionic acid ((IV), Ph is as defined in
20 formula (I)). This may be obtained by, for example, resolving the corresponding DL-diethyl-2-benzylsuccinate (V) with chymotrypsin according to the procedure of Cohen et al., Journal of the American Chemical Society (1968) 90, 3495, the enzyme selectively
25 revealing the required carboxyl group.

In an alternative procedure the reagent (II) is a 3-benzyloxycarbonyl-2-benzylidenepropionic acid ((VI), Ph is as defined in formula (I) and Bzl is benzyl)

which may be prepared by preferentially opening the corresponding benzylidene succinic anhydride (VII) with benzyl alcohol according to the procedure of Cohen et al., ibid. to again provide the required carboxyl group.

The acid (VI) is reacted with a reagent (III) as hereinabove defined to provide (VIII) and the double bond in the latter reduced by, for example, hydrogenation

in the presence of palladium charcoal. The hydrogenation will also effect conversion of the benzyloxy-carbonyl group to the free (deprotected) carboxyl and it is convenient (where the desired amide of formula (I) has Z as hydroxyl) for Z¹ in (III) to be benzyloxy as the latter group will be similarly deprotected.

When the preparative procedures hereinabove described provide a mixture of optical isomers of the amide of formula (I) or of an intermediate thereto, for example a mixture of diastereoisomers, the individual isomers may be separated by appropriate conventional physical techniques such as high performance liquid chromatography, preparative thin layer chromatography and the like.

Because of their selective enkephalinase-inhibiting activity the amides of formula (I) and the basic salts thereof are of value in the in vitro and in vivo investigation of the mode of action and role of the enzyme and in its localization, isolation and purification.

For example, the present invention provides a method which comprises contacting an amide of formula (I) or a basic salt thereof with enkephalinase and determining the inhibitory effect of the amide or salt on the enzyme activity of the enkephalinase. This method can be used to compare the enkephalinase inhibitory effect of the above compounds with other compounds having a similar effect. The compounds according to the invention can be radiolabelled, if desired, to facilitate the determination of their inhibitory effect.

Their selective enkephalinase-inhibiting activity also confers on the amides of formula (I) and the pharmacologically and pharmaceutically acceptable basic salts thereof utility in the prolongation and/or

5 potentiation in a mammal of the effects of enkephalins of either endogenous or exogenous origin including in the later case synthetic enkephalin analogues. The said amides and salts thus have the same activities and utilities as have been indicated for the endogenous compounds.

10 In particular, the amides of formula (I) and the pharmacologically and pharmaceutically acceptable basic salts thereof have morphinomimetic (morphine agonist) activity and thus may be used in the treatment of mammals in the fields of both human and veterinary medicine in

15 any condition where an agent with a morphine-like effect is indicated.

The pharmacological properties and therapeutic uses of morphine are well documented in the literature (see for example 'The Pharmacological Basis of Therapeutics',

20 Goodman, L S and Gilman, A eds., published by Macmillan Publishing Co., Inc., New York, fifth edition (1975), ISBN 0-02-344781-8, especially at Chapter 15 pages 245 to 283, and

'Martindale: The Extra Pharmacopoeia', Wade, A ed., published by The Pharmaceutical Press, London, twenty-seventh edition

25 (1977), ISBN 0-85369-114-2, especially at pages 970 to 974) and specific utilities for the said amides and salts include, by way of example, the following.

(1) The relief of pain (analgesia), for example pain arising from spasm of smooth muscle as in renal or biliary colic, pain in terminal illness such as terminal cancer, pain in the postoperative period, and obstetrical pain.

(2) The induction of constipation, for example after ileostomy or colostomy.

(3) The treatment of diarrhoea or dysentery.

(4) The suppression of cough.

(5) The induction of sleep, especially where sleeplessness is due to pain or cough.

(6) Sedation, for example in pre-anaesthetic medication to reduce preoperative apprehension.

(7) Tranquillization, for example when allied to the relief of pain in terminal illness such as terminal cancer, and the relief of anxiety in general.

(8) The induction of euphoria and the treatment of depression, for example when allied to the relief of pain in terminal illness such as terminal cancer.

(9) The relief of dyspnoea, for example that of acute left ventricular failure or pulmonary oedema.

The amides of formula (I) and the pharmacologically and pharmaceutically acceptable basic salts thereof (hereafter collectively referred to as the active ingredients) may be administered to the human or non-human recipient by any route appropriate to the condition to be treated, suitable routes including

oral, rectal, nasal, topical (including buccal and sublingual), vaginal and parenteral (including subcutaneous, intramuscular, intravenous, intradermal, intrathecal and epidural). It will be appreciated
5 that the preferred route may vary with for example the condition of the recipient.

For each of the above-indicated utilities and indications the amount required of an active ingredient (as above defined) will depend upon a number of factors
10 including the severity of the condition to be treated and the identity of the recipient and will ultimately be at the discretion of the attendant physician or veterinarian. In general however, for each of these utilities and indications, a suitable, effective dose
15 will be in the range 0.075 μ g to 12 mg per kilogram bodyweight of recipient (human or non-human) per day, preferably in the range 0.75 μ g to 1.2 mg per kilogram bodyweight per day and most preferably in the range 7.5 to 120 μ g per kilogram bodyweight per day;
20 an optimum dose is 30 μ g per kilogram bodyweight per day. (Unless otherwise indicated all weights of active ingredient are calculated as the amide of formula (I): for salts thereof the figures would be increased proportionately.) The desired dose is
25 preferably presented as between two and four sub-doses administered at appropriate intervals throughout the day. Thus where three sub-doses are employed each

will generally lie in the range 0.025 μ g to 4 mg,
preferably 0.25 μ g to 0.4 mg and most preferably 2.5
to 40 μ g per kilogram bodyweight with an optimum of
10 μ g per kilogram bodyweight. A daily dose for a
5 human weighing of the order of 50 kg will thus
generally lie in the range 3.75 μ g to 600 mg,
preferably in the range 37.5 μ g to 60 mg and most
preferably in the range 0.375 to 6.0 mg and may con-
veniently be presented as three equal unit sub-doses
10 of 1.25 μ g to 200 mg, preferably 12.5 μ g to 20 mg and
most preferably 0.125 to 2.0 mg. Optimally a human
daily dose, for an individual weighing of the order
of 50 kg, is 1.5 mg conveniently presented as three
unit sub-doses each of 0.5 mg.

15 While it is possible for the active ingredients to
be administered as the raw chemical it is preferable
to present them as a pharmaceutical formulation pre-
paration. The formulations, both veterinary and for
human use, of the present invention comprise an active
20 ingredient, as above defined, together with one or
more acceptable carriers therefor and optionally other
therapeutic ingredients. The carrier(s) must be
"acceptable" in the sense of being compatible with the
other ingredients of the formulation and not deleterious
25 to the recipient thereof.

The formulations include those suitable for oral,
rectal, nasal, topical (including buccal and sublingual),

vaginal or parenteral (including subcutaneous, intra-
muscular, intravenous, intradermal, intrathecal and
epidural) administration. The formulations may con-
veniently be presented in unit dosage form and may be
5 prepared by any of the methods well known in the art
of pharmacy. All methods include the step of bringing
into association the active ingredient with the carrier
which constitutes one or more accessory ingredients.
In general the formulations are prepared by uniformly
10 and intimately bringing into association the active
ingredient with liquid carriers or finely divided solid
carriers or both, and then, if necessary, shaping the
product.

Formulations of the present invention suitable for
15 oral administration may be presented as discrete units
such as capsules, cachets or tablets each containing
a predetermined amount of the active ingredient; as
a powder or granules; as a solution or a suspension in
an aqueous liquid or a non-aqueous liquid; or as an
20 oil-in-water liquid emulsion or a water-in-oil liquid
emulsion. The active ingredient may also be pre-
sented as a bolus, electuary or paste.

A tablet may be made by compression or moulding,
optionally with one or more accessory ingredients.
25 Compressed tablets may be prepared by compressing in
a suitable machine the active ingredient in a free-
flowing form such as a powder or granules, optionally

mixed with a binder, lubricant, inert diluent, lubricating, surface active or dispersing agent. Moulded tablets may be made by moulding in a suitable machine a mixture of the powdered compound moistened with an
5 inert liquid diluent. The tablets may optionally be coated or scored and may be formulated so as to provide slow or controlled release of the active ingredient therein.

Formulations for rectal administration may be
10 presented as a suppository with the usual carriers such as cocoa butter.

Formulations suitable for nasal administration wherein the carrier is a solid include a coarse powder having a particle size for example in
15 the range 20 to 500 microns which is administered in the manner in which snuff is taken, i.e. by rapid inhalation through the nasal passage from a container of the powder held close up to the nose. Suitable formulations wherein the carrier is a liquid, for
20 administration as for example a nasal spray or as nasal drops, include aqueous or oily solutions of the active ingredient.

Formulations suitable for topical administration in the mouth include lozenges comprising the active ingredient in a flavoured basis, usually sucrose and acacia
25 or tragacanth; and pastilles comprising the active ingredient in an inert basis such as gelatin and glycerin, or sucrose and acacia.

Formulations suitable for vaginal administration may be presented as pessaries, creams, pastes or spray formulations containing in addition to the active ingredient such carriers as are known in the art to be appropriate.

Formulations suitable for parenteral administration include aqueous and non-aqueous sterile injection solutions which may contain anti-oxidants, buffers, bacteriostats and solutes which render the formulation isotonic with the blood of the intended recipient; and aqueous and non-aqueous sterile suspensions which may include suspending agents and thickening agents. The formulations may be presented in unit-dose or multi-dose containers, for example sealed ampoules and vials, and may be stored in a freeze-dried (lyophilized) condition requiring only the addition of the sterile liquid carrier, for example water for injections, immediately prior to use. Extemporaneous injection solutions and suspensions may be prepared from sterile powders, granules and tablets of the kind previously described.

Preferred unit dosage formulations are those containing a daily dose or unit daily sub-dose, as hereinabove recited, or an appropriate fraction thereof, of an active ingredient.

It should be understood that in addition to the ingredients particularly mentioned above the formu-

lations_____ of this invention may include other agents conventional in the art having regard to the type of formulation in question, for example those suitable for oral administration may include flavouring agents.

All references identified hereinabove or in the following are hereby incorporated herein by reference thereto.

Those basic salts which are not pharmacologically and pharmaceutically acceptable may be converted to the amides themselves and to salts thereof which are acceptable by standard procedures.

It will be understood from the foregoing description that this invention may comprise any novel feature described herein, principally but not exclusively for example:

- 5 (a) Amides of formula (I) as hereinbefore defined and the basic salts thereof.
- (b) Methods as hereinbefore described for the preparation of compounds according to (a) supra, together with the compounds when so prepared.
- 10 (c) A pharmaceutical formulation comprising a therapeutically effective amount of an amide of formula (I) as hereinbefore defined or a pharmacologically and pharmaceutically acceptable basic salt thereof together with an acceptable carrier therefor.
- 15 (d) A method for the preparation of a formulation according to (c) supra comprising admixture of the active ingredient, as defined, with the carrier therefor.
- (e) Amides of formula (I) as hereinbefore defined
20 and pharmacologically and pharmaceutically acceptable basic salts thereof, for use in the therapeutic treatment of a mammal.
- (f) Amides of formula (I) as hereinbefore defined and pharmacologically and pharmaceutically acceptable
25 basic salts thereof, for use in the therapeutic treatment of a human.
- (g) Amides of formula (I) as hereinbefore defined

and pharmacologically and pharmaceutically acceptable basic salts thereof, for use in prolongation and/or potentiation in a mammal of the effects of endogenous or exogenous enkephalins.

5 (h) Amides of formula (I) as hereinbefore defined and pharmacologically and pharmaceutically acceptable basic salts thereof, for use in the treatment of a mammal for a condition where an agent with a morphine-like effect is indicated.

10 (i) Amides of formula (I) as hereinbefore defined and pharmacologically and pharmaceutically acceptable basic salts thereof, for use in the treatment of a mammal for a condition selected from those specifically identified hereinabove under (1), (2), (3), (4), (5),
15 (6), (7), (8) or (9).

(j) A method for the prolongation and/or potentiation in a mammal of the effects of endogenous or exogenous enkephalins comprising administration to the mammal of a non-toxic, therapeutically effective amount of an amide of formula
20 (I) as hereinbefore defined or a pharmacologically and pharmaceutically acceptable basic salt thereof.

(k) A method for the treatment of a mammal for a condition where an agent with a morphine-like effect is indicated comprising administration to the mammal
25 of a non-toxic, therapeutically effective amount of an amide of formula (I) as hereinbefore defined or a pharmacologically and pharmaceutically acceptable basic

salt thereof.

(1) A method for the treatment of a mammal for a condition selected from those specifically identified hereinabove under (1), (2), (3), (4), (5), (6), (7),
5 (8) or (9) comprising administration to the mammal of a non-toxic, therapeutically effective amount of an amide of formula (I) as hereinbefore defined or a pharmacologically and pharmaceutically acceptable basic salt thereof.

10 (m) A method according to (j), (k) or (l) supra wherein the mammal is man.

(n) Novel compounds of formulae (II), (III), (IV), (V), (VI), (VII) and (VIII) as hereinbefore defined.

15 The following Examples are provided in illustration of the present invention and should not be construed as in any way constituting a limitation thereof. All temperatures are in degrees Celsius.

EXAMPLE 1

(2S)-2-[(2RS)-2-Benzyl-3-carboxypropanamido]-4-methylpentanoic acid (compound 1)

5 Step (a): N-[DL-2-benzyl-3-carbethoxypropanoyl]-L-leucine methyl ester

The above ester was prepared by condensing (+)-2-benzyl-3-carbethoxypropionic acid (5.07 g) with L-leucine methyl ester hydrochloride (3.90 g) in dimethylformamide (50 ml) in the presence of 1-hydroxybenzotriazole (5.80 g), dicyclohexylcarbodiimide (4.43 g) and triethylamine (2.97 ml) according to customary procedures. The product was an oil (6.85 g).

Step (b): (2S)-2-[(2RS)-2-Benzyl-3-carboxypropanamido]-4-methylpentanoic acid

15 The oil from step (a) (6.85 g) was dissolved in methanol (75 ml) and water (8 ml) and saponified (pH stat) at pH 12.0 with N sodium hydroxide. After the addition of 41.5 ml of alkali, the mixture was concentrated in vacuo to remove the methanol, diluted with
20 25 ml water and filtered. The filtrate was cooled to 0°C and acidified by the addition of 2N hydrochloric acid (20.8 ml) and extracted twice with ethyl acetate (150 ml). The combined extracts were washed with 50%-saturated sodium chloride solution (25 ml), dried and
25 evaporated. The residue was triturated with ether, the solid filtered and crystallised from aqueous ethanol as colourless prisms, m.pt. 165°-167°C;

$[\alpha]_D^{23} = -22.7^\circ$, $c = 1.0$ in ethanol; R_f 0.35¹ and 0.66¹, 0.62².

Analysis $C_{17}H_{23}NO_5$ requires C, 63.55; H, 7.17; N, 4.36%
found C, 63.63; H, 7.15; N, 4.43%

5 EXAMPLE 2

(2S)-2-[(2RS)-2-Benzyl-3-carboxypropanamido]-4-methylpentanoic acid (compound 1)

Step (a): N-[3-Benzyloxycarbonyl-2-benzylidenepropanoyl]-L-leucine benzyl ester

10 To a solution of 3-benzyloxycarbonyl-2-benzylidene-propionic acid (8.88 g) in dimethylformamide (100 ml) cooled to -10°C was added 1-hydroxybenzotriazole (8.10 g) and dicyclohexylcarbodiimide (6.18 g). After stirring for 15 minutes L-leucine benzyl ester hydro-
15 chloride (6.73 g) and triethylamine (4.15 g) were added and stirring continued at $+4^\circ\text{C}$ for 24 hours. The dicyclohexylurea was removed by filtration and the filtrate evaporated in vacuo. The residue was dissolved in ethyl acetate and acid/base washed in the usual
20 manner, dried and concentrated in vacuo, to give an oil (14 g).

Step (b): (2S)-2-[(2RS)-2-Benzyl-3-carboxypropanamido]-4-methylpentanoic acid

25 The oil from step (a) (14 g) was hydrogenated in methanol (250 ml) in the presence of 10% (w/w) palladium on charcoal catalyst (2 g). When the uptake of

hydrogen ceased, the catalyst was filtered and the filtrate concentrated in vacuo to give a residue which solidified on trituration with ether and was found to be identical with the product of Example 1.
5 $[\alpha]_D^{18} = -24.6^\circ$, $c = 1.0$ in methanol; R_f 0.35¹ and 0.66¹, the two spots of equal intensity when located with iodine/starch reagent.

EXAMPLE 3

The product of Example 2 was fractionated on a
10 Waters Associates Preparative LC (System. 500) using silica gel cartridges (Preppak 500) and the solvent system methylene dichloride containing methanol (4%) and glacial acetic acid (1%). The components were identified by acid hydrolysis to their constituents as:

15 (2S)-2-[(2R)-2-benzyl-3-carboxypropanamido]-4-methylpentanoic acid (compound 2); $[\alpha]_D^{18} = +24.8^\circ$, $c = 1.0$ in methanol; R_f 0.66¹; m.pt. 139-140°C, yielding L-leucine and (+)-benzylsuccinic acid; and

20 (2S)-2-[(2S)-2-benzyl-3-carboxypropanamido]-4-methylpentanoic acid (compound 3); $[\alpha]_D^{18} = -74.5^\circ$, $c = 1.0$ in methanol; R_f 0.36¹; m.pt. 199-201°C, yielding L-leucine and (-)-benzylsuccinic acid.

EXAMPLE 4

25 (2S)-2-[(2R)-2-Benzyl-3-carboxypropanamido]-4-methylpentanamide (compound 4)

Step (a): N-[D-2-benzyl-3-carbethoxypropanoyl]-L-leucinamide

The above amide was prepared by standard procedures from (+)-2-benzyl-3-carbethoxypropionic acid (4.62 g), L-leucinamide hydrochloride (3.26 g), 1-hydroxybenzotriazole (5.29 g), dicyclohexylcarbodiimide (4.03 g) and triethylamine (2.71 ml) in dimethylformamide (50 ml). The product was isolated as an amorphous solid (3.71 g) by precipitation from isopropanol with diisopropyl ether.

Rf 0.44⁴, 0.55 (methylethylketone).

Analysis C₁₉H₂₈N₂O₄ requires C, 65.51; H, 8.05; N, 8.05%
found C, 65.14; H, 8.41; N, 8.16%

Step (b): (2S)-2-[(2R)-2-Benzyl-3-carboxypropanamido]-4-methylpentanamide.

The product of step (a) (1.74 g) in methanol (45 ml) and water (5 ml) was saponified using N sodium hydroxide (pH stat 12.0). The product obtained after customary procedures crystallised from aqueous methanol in colourless prisms, m.pt. 214-215°C; $[\alpha]_D^{23} = -86.9^\circ$, c = 0.5 in methanol; Rf 0.58¹.

Analysis C₁₇H₂₄N₂O₄ requires C, 63.75; H, 7.50; N, 8.75%
found C, 63.89; H, 7.68; N, 8.80%

EXAMPLE 5

t-butyl (2S)-2-[(2RS)-3-Acetylthio-2-benzylpropanamido]-4-methylpentanoate (compound 5)

Step (a): DL-3-Acetylthio-2-benzylpropionic acid

2-Benzylacrylic acid (16.2 g) (prepared according
to the procedure of C.

Mannich and K. Risert, Ber. (1924) 57, 1116, from
5 diethyl benzylmalonate) was stirred at ambient tempera-
ture for 1 hour with thiolacetic acid (10 ml). The
mixture was then heated on a steam bath for 1 hour,
concentrated under reduced pressure and then re-evapo-
rated three times with benzene (50 ml).

10 The residue was dissolved in a mixture of dry
ether (20 ml) and hexane (50 ml) and redistilled dicyclo-
hexylamine (19.5 ml) in hexane (50 ml) added. The
crystalline dicyclohexylamine salt (33.5 g) was filtered
and washed with hexane, m.pt. 102-103°C.

15 Analysis $C_{24}H_{37}NO_3S$ requires C, 68.74; H, 8.83; N, 3.34%
found C, 68.85; H, 8.99; N, 3.13%

The salt was suspended in ethyl acetate (200 ml)
and stirred vigorously with potassium bisulphate (16 g)
in water (50 ml). The ethyl acetate phase was sepa-
20 rated, washed with water (50 ml), dried (anhydrous
sodium sulphate) and concentrated in vacuo to give the
product acid as an oil (19.8 g).

Step (b): t-butyl(2S)-2-[(2RS)-3-Acetylthio-2-benzyl-
propanamido]-4-methylpentanoate

25 DL-3-Acetylthio-2-benzylpropionic acid (5.39 g) was
dissolved in methylene dichloride (75 ml) and cooled to
-10°C. 1-Hydroxybenzotriazole (6.11 g) and dicyclo-

hexylcarbodiimide (4.66 g) were added. After stirring for 20 minutes, L-leucine tert.butyl ester (4.24 g) were added and stirring continued for 24 hours at +4°C. The dicyclohexylurea was filtered and the filtrate concentrated in vacuo. The residue was dissolved in ethyl acetate (50 ml) and after refrigeration additional urea removed by filtration. The filtrate was diluted to 350 ml with ethyl acetate and washed successively with 50 ml portions of 5% citric acid, 50%-saturated sodium chloride, saturated sodium bicarbonate and 50%-saturated sodium chloride solutions. The solution was dried (anhydrous sodium sulphate) and concentrated in vacuo to give a crystalline solid which was recrystallised from light petroleum, m.pt. 80-81°C.

EXAMPLE 6

(2S)-2-[(2RS)-3-Acetylthio-2-benzylpropanamido]-4-methylpentanoic acid, dicyclohexylamine salt
(compound 6)

The t-butyl ester product of Example 5 (9 g) was stirred at ambient temperature for one hour with redistilled trifluoroacetic acid (100 ml) and anisole (50 ml). The mixture was concentrated in vacuo and the residue partitioned between saturated sodium bicarbonate solution (100 ml) and ethyl acetate (250 ml). The aqueous phase was acidified and extracted twice

with ethyl acetate (150 ml). The combined extracts were washed with 50%-saturated sodium chloride solution, dried (anhydrous sodium sulphate) and concentrated in vacuo. The residual gum (6.5 g) was
5 dissolved in ethyl acetate (30 ml) and redistilled dicyclohexylamine (4.4 ml) added. The crystalline salt was filtered, washed with cold ethyl acetate and recrystallised from acetonitrile as colourless prisms, m.pt. 144-146°C; $[\alpha]_D^{19} = -16.58^\circ$, c = 1.0 in
10 methanol; Rf 0.68¹.

Analysis $C_{30}H_{48}N_2O_4S, 1.5H_2O$
requires C, 64.40; H, 9.12; N, 5.00%
found C, 64.74; H, 9.00; N, 4.88%

EXAMPLE 7

15 (2S)-2-[(2RS)-2-Benzyl-3-mercaptopropanamido]-4-methylpentanoic acid, dicyclohexylamine salt (compound 7).

The dicyclohexylamine salt product of Example 6 (6.2 g) was suspended in ethyl acetate (100 ml) and
20 stirred vigorously with potassium bisulphate (2.1 g) in water (20 ml). The ethyl acetate phase was washed with water (25 ml), dried (anhydrous sodium sulphate) and concentrated in vacuo.

The residue (4.1 g) was stirred under argon for
25 2 hours with 5.5N ammonia in methanol (50 ml). The solution was concentrated in vacuo. The residue was

dissolved in ethyl acetate (100 ml) and shaken successively with 15 ml portions of 5% aqueous citric acid and 50%-saturated sodium chloride solutions.

The solution after drying was concentrated in vacuo.

5 The residue was dissolved in ether (25 ml) under argon and redistilled dicyclohexylamine (1.3 ml) added.

The crystalline dicyclohexylamine salt was filtered as colourless prisms and washed with ether and light

petroleum, m.pt. 154-155°C.; $[\alpha]_D^{19} = -34.2^\circ$, c = 0.7

10 in methanol; Rf 0.68¹.

Analysis C₂₈H₄₆N₂O₃S requires C, 68.57; H, 9.39; N, 5.71%
found C, 68.19; H, 9.17; N, 5.61%

The product gave positive reactions for -SH with alkaline sodium nitroprusside and with sodium azide/
15 iodine solutions.

EXAMPLE 8

(2S)-2-[(2RS)-3-Acetylthio-2-benzylpropanamido]-4-methylpentanamide (compound 8)

A mixture of DL-3-acetylthio-2-benzylpropionic
20 acid(Example 5, step (a)) (4.82 g), 1-hydroxybenzotriazole (5.47 g) and dicyclohexylcarbodiimide (4.17 g) were stirred in dimethylformamide (60 ml) for 30 mins. at -10°C. L-Leucinamide hydrochloride (3.37 g) and triethylamine (2.80 ml) were added and stirring con-
25 tinued at +4°C for 24 hours. The dicyclohexylurea was filtered and the filtrate concentrated in vacuo.

The residue was dissolved in ethyl acetate and acid/
base washed in the usual manner. Evaporation of the
solvent and recrystallisation of the residue from
isopropanol/diisopropyl ether gave colourless prisms,
5 m.pt. 128-130°C.

Analysis $C_{30}H_{49}N_3O_3S$ requires C, 61.71; H, 7.43; N, 8.00%
found C, 61.85; H, 7.27; N, 8.35%

EXAMPLE 9

10 (2S)-2-[(2RS)-2-Benzyl-3-mercaptopropanamido]-4-methyl-
pentanamide (compound 9)

The product of Example 8 (3.65 g) was stirred for
2 hours under argon with 5.5N ammonia in methanol
(50 ml). The mixture was concentrated in vacuo, the
residue triturated with water and the solid filtered
15 and recrystallised from aqueous isopropanol as colour-
less needles, m.pt. 145°C; $[\alpha]_D^{20} = -45.1^\circ$, c = 1.0
in methanol; Rf 0.30⁴.

Analysis $C_{16}H_{24}N_2O_2S \cdot 0.5H_2O$
requires C, 60.57; H, 7.89; N, 8.83%
20 found C, 60.44; H, 7.45; N, 8.38%

EXAMPLE 10

(2R)-2-[(2R)-2-Benzyl-3-carboxypropanamido]-4-methyl-
pentanamide (compound 10)

This was prepared in an analogous manner to the
25 corresponding (2S)-2-(2R) compound (4, Example 4),

using instead D-leucinamide hydrochloride in the first step.

The product was obtained as colourless prisms,
m.pt. 212-214°C; $[\alpha]_D^{24} = +94.3^\circ$, $C = 0.5$ in methanol;
Rf 0.58¹, 0.48².

Analysis $C_{17}H_{24}N_2O_4$ requires C, 63.75; H, 7.50; N, 8.75%
found C, 63.58; H, 7.20; N, 8.60%

EXAMPLE 11

By analogous procedures to those set out in
Example 1, substituting for the L-leucine methyl ester
hydrochloride in step (a) therein respectively D-
leucine methyl ester hydrochloride, D-methionine methyl
ester hydrochloride and L-methionine methyl ester
hydrochloride, there were prepared the following:

(2R)-2-[(2RS)-2-Benzyl-3-carboxypropanamido]-4-
methylpentanoic acid (compound 11);

colourless prisms, m.pt. 164-166°C; $[\alpha]_D^{22} = +25.7^\circ$,
 $C = 0.5$ in methanol; Rf 0.35¹ and 0.66¹, 0.21².

Analysis $C_{17}H_{23}NO_5$ requires C, 63.55; H, 7.17; N, 4.36%
found C, 63.42; H, 7.12; N, 4.43%

(2R)-2-[(2RS)-2-Benzyl-3-carboxypropanamido]-4-
(methylthio)butanoic acid (compound 12);

colourless prisms, m.pt. 131-134°C (decomp.);
 $[\alpha]_D^{21} = +14.9^\circ$, $c = 1.0$ in methanol; Rf 0.35¹ and
0.43¹, 0.51², 0.63³.

Analysis $C_{16}H_{21}NO_5S$ requires C, 56.64; H, 6.19; N, 4.13%
found C, 56.61; H, 6.24; N, 4.13%

(2S)-2-[(2RS)-2-Benzyl-3-carboxypropanamido]-4-(methylthio)butanoic acid (compound 13);

5 colourless prisms, m.pt. 137-139°C; $[\alpha]_D^{21} = -7.48^\circ$,
c = 0.5 in methanol; Rf 0.35¹ and 0.43¹; 0.51²; 0.69³.
Analysis $C_{16}H_{21}NO_5S$ requires C, 56.64; H, 6.19; N, 4.13%
found C, 56.61; H, 6.26; N, 4.15%

EXAMPLE 12

10 (2S)-2-[(2RS)-3-Carboxy-2-(4-nitrobenzyl)propanamido]-
4-methylpentanoic acid (compound 14)

Diethyl (p-nitrobenzyl)malonate, prepared by
treating diethyl benzylmalonate with fuming nitric
acid, was converted to p-nitrobenzylsuccinic acid and
15 thence to diethyl (p-nitrobenzyl)succinate by con-
ventional procedures and the latter diester resolved
with chymotrypsin according to the method of Cohen
et al., J.A.C.S. (1968) 90, 3495. The (+)-3-
carbethoxy-2-(4-nitrobenzyl)propionic acid thereby
20 obtained was reacted with L-leucine methyl ester
hydrochloride in the usual manner in the presence of
1-hydroxy-1H-benzotriazole and dicyclohexylcarbodiimide
and the resulting protected product saponified with
N sodium hydroxide to yield the title compound.

25 Colourless prisms, m.pt. 143-145°C; $[\alpha]_D^{20}$
= -23.6°, c = 0.5 in methanol; Rf 0.30¹ and 0.67¹,

0.46²

Analysis C₁₇H₂₂N₂O₇ requires C, 55.74; H, 6.01; N, 7.65%
found C, 55.97; H, 6.28; N, 7.99%

EXAMPLE 13

(2R)-2-[2RS-2-Benzyl-3-mercaptopropanamido]-4-(methylthio)-
5 butanoic acid (compound 15)

Step (a) t-Butyl(2R)-2-[2RS-3-acetylthio-2-benzylpropanamido]-
4-(methylthio)butanoate

3-Acetylthio-2-benzylpropionic acid (4.75g) was dissolved
in methylene dichloride (75ml) cooled to -10°C and 1-hydroxy-
10 benzotriazole (5.4g) and dicyclohexylcarbodiimide (4.11g)
added. After 1 hour, D-methionine tert-butyl ester (4.09g) was
added and stirring continued at +4°C overnight. The
mixture was filtered and the filtrate concentrated in vacuo.
The residue was dissolved in ethyl acetate (350ml) and
15 washed successively with 50ml portions of 50% saturated
sodium chloride solution; 5% citric acid solution; saturated
sodium bicarbonate solution; 50% saturated sodium chloride
solution. The solution was dried (MgSO₄) and concentrated
to an oil (8.0g) in vacuo. Rf 0.82⁵; 0.79⁴; 0.88⁶.

20 Step (b) (2R)-2-[2RS-3-Acetylthio-2-benzylpropanamido]-4-
(methylthio)butanoic acid

The oil obtained in step (a) was dissolved in anisole
(50ml), trifluoroacetic acid (100ml) added and the solution
stirred at ambient temperature for 2 hours. The mixture was
25 concentrated in vacuo to give an oily residue (6.97g).
Rf 0.76⁶.

0038046

Step (c) (2R)-2-[2RS-2-Benzyl-3-mercaptopropanamido]-4-
(methylthio)butanoic acid

The oil residue obtained in step (b) was stirred at ambient temperature under argon for 2 hours with 5.08N ammonia in methanol (75ml). The solution was evaporated in vacuo and the residue dissolved in ethyl acetate (125ml), washed with 15ml portions of 5% citric acid solution and 50% saturated sodium chloride solution, dried (MgSO_4) and concentrated in vacuo to an oil.

The oil (5.4g) was dissolved in dry ether (50ml) and dicyclohexylamine (3.2ml) added. The precipitate was filtered and dried, m.pt. 155°C after sintering at 145°C ; $[\alpha]_D^{21} = +7.9^\circ$ ($c=0.5$ in methanol); R_f 0.70⁶.

Analysis $\text{C}_{27}\text{H}_{44}\text{N}_2\text{O}_3\text{S}_2$ requires C, 63.78; H, 8.66; N, 5.51%
found C, 63.86; H, 8.94; N, 5.50%

In the foregoing Examples, the Rf figures refer to thin layer chromatography using Merck silica gel plates and the following solvent systems:

- 1) chloroform: methanol: 5% (v/v) acetic acid
5 (120:90:5)
- 2) chloroform: methanol: 5% ammonia (120:90:5)
- 3) n-butanol: acetic acid: water (3:1:1)
- 4) chloroform: methanol (8:1)
- 5) methyl ethyl ketone
- 6) chloroform: methanol: 32% acetic acid (120:90:5)

ACTIVITY IN VITRO

The compounds were investigated for enkephalinase-inhibiting activity using the following methods.

A) Purified enkephalinase A1 was obtained according to the following procedure (modification of the method of Gorenstein and Snyder, Life Sciences, Vol. 25, pages 2065-2070, 1979).

Rats were killed by decapitation and the striata dissected out on ice. The pooled tissues were homogenised in ice-cold Tris/hydrochloric acid buffer (50mM, pH 7.70, 30 ml per gram of tissue) and centrifuged (50,000 g, 15 mins). The resulting supernatant was discarded and the remaining pellet washed three times. The washed pellet was solubilised by resuspension in half the volume of buffer as before containing 1.0% (v/v) Triton X-100 and incubated at 37°C for 45 mins. The suspension was then centrifuged at 100,000 g for 60 mins and the solubilised enzymes contained in the supernatant separated by DEAE-cellulose column chromatography. Enkephalinase A1 was further purified by Sephacryl S.300 chromatography.

Enkephalinase-inhibiting activity was estimated by the following procedure. 1.75µl of leucine enkephalin (0.317 mg/ml), 0.5µl of ³H-leucine enkephalin (L-tyrosyl-3,5-³H)Enkephalin(5-L-Leucine), The Radiochemical Centre, Amersham, England) and 5.75µl of buffer as before were incubated at 30°C for 10 mins with 2µl of either a solution of test compound (in either 50% ethanol/0.1M

sodium hydrogen carbonate or distilled water) or solvent alone as control. 10 μ l of purified enkephalinase A1 at 30°C were added and incubation then continued for a further 30 mins (total incubation time 40 mins, final leucine enkephalin concentration 5 x 10⁻⁵M, final ³H-leucine enkephalin concentration 12.5 μ Ci/ml). At the completion of incubation 3 μ l of 0.16 M hydrochloric acid was added and the incubation mixture cooled on ice.

Separation of (a) unchanged ³H-leucine enkephalin and ,
 10 (b) ³H-Tyr-Gly-Gly-OH (³H-TGG), generated from (a) by enkephalinase A1 in the incubation mixture was effected by thin layer chromatography (plastic silica gel plates of 0.1 mm layer thickness, solvent system ethyl acetate: propan-2-ol: 5% (v/v) acetic acid, 2:2:1) using solutions
 15 of the cold compounds as carriers. After drying the materials were visualized with ninhydrin and appropriate areas of the plates cut out and placed in scintillation vials containing 50% methanol/0.1 M hydrochloric acid to elute the ³H label. Biofluor reagent (10 ml) was then added
 20 and the radioactivity determined by liquid scintillation counting.

The ³H-TGG generated in the presence of test compound (expressed as a percentage of the control figure) was then calculated and an approximate IC₅₀ figure (concentration
 25 of test compound required for 50% inhibition of ³H-TGG generation) then determined graphically.

B) The following method is a modification of the method of Malfroy et al; Nature Vol. 276, 30 November 1978 pages 523 to 526.

Three rats were killed by decapitation and the striata dissected out on ice. The pooled tissues were homogenised in ice-cold Tris/hydrochloric acid buffer (50 mM, pH 7.60, 10.0 ml) and centrifuged (1000 g, 10 mins). The resulting supernatant was recentrifuged (47,000 g, 20 mins) and the second supernatant discarded. The pellet was washed twice and finally resuspended in buffer as before (9.6 ml) and aliquots (1.9 ml) of this suspension incubated at 22°C. Five minutes after incubation commenced 20 µl of either a solution of the test compound (in either buffer as before or in ethanol or dimethylsulphoxide) or solvent alone as control was added followed after a further five minutes by a solution of ³H-leucine enkephalin (The Radiochemical Centre, Amersham, England) (80 µl, final concentration 3×10^{-8} M, 1.25 µCi/ml) and incubation then continued for a further 30 mins. (total incubation time 40 mins). At the completion of incubation N hydrochloric acid (50 µl) was added, the mixture heated in a boiling water bath for 15 mins and precipitated material then removed by centrifugation (1500 g, 10 mins).

Separation of

- (a) unchanged ^3H -leucine enkephalin,
- (b) ^3H -Tyr-Gly-Gly-OH (^3H -TGG), generated from (a) by
enkephalinase, and
- 5 (c) ^3H -Tyr-OH, generated from both (a) and (b) by
aminopeptidase(s)

in the supernatant and the subsequent procedure was
carried out as described in method A) above. In this
method, the IC_{50} figure could be only approximate due
10 to catabolism of ^3H -TGG, once generated, by amino-
peptidase(s) in the tissue homogenate (vid.sup.).

The results are set out in the following Table,
the figures marked with an asterisk being obtained
using method B, the others using method A. For comparison
15 purpose, the IC_{50} figure for captopril (obtained using
method A above) is also given.

	<u>Compound</u>	<u>Approx IC₅₀(M)</u>
	1	1.7×10^{-5}
	2	$7.2 \times 10^{-6} *$
	3	$4.0 \times 10^{-6} *$
5	4	$>1.0 \times 10^{-4}$
	6	1.1×10^{-5}
	7	1.4×10^{-7}
	9	3.3×10^{-7}
	10	$>1.0 \times 10^{-4} *$
10	11	$>5 \times 10^{-4}$
	12	1.9×10^{-5}
	13	4.3×10^{-6}
	14	6.5×10^{-5}
	15	1.5×10^{-7}
15	(Captopril	$3 \times 10^{-3})$

Antinociceptive activity

0038046

The antinociceptive activity of compound 1 was tested in vivo in mice using the following method:-

Method

5 A modification of the writhing assay of Siegmund
et al (Proc. Soc. exp. Biol. Med., 1957, 95: 727-731)
was used. Compound 1 dissolved in saline, or saline alone,
was administered intracerebroventricularly (i.c.v.) to
groups of 5 mice at the doses shown below. 1 hour or
10 2 hours later, the mice were injected i.p. with the
nonciceptive stimulus, i.e. 0.6% (v/v) aqueous acetic
acid. 20 minutes after the injection, the number of writhes
exhibited over a 2.5 minute period was counted. An
antinociceptive compound will reduce the number of writhes
15 and this may be expressed as a percentage inhibition:

% inhibition =

$$\frac{\text{no of writhes (saline treated)} - \text{no of writhes (drug treated)}}{\text{no of writhes (saline treated)}} \times 100$$

Results

20	<u>Dose</u> <u>(µg mouse)</u>	<u>% inhibition of writhes</u> <u>Time prior to acetic acid</u>	
		<u>1h</u>	<u>2h</u>
	40	75	84
	20	32	44
25	10	28	48
	5	slight potentiation	36

Pharmaceutical Formulations

The compound of formula (I) employed in the following Examples of pharmaceutical formulations may be any compound of formula (I) defined above or a basic salt thereof.

A) Tablet Formulation (0.5 mg/tablet)

5	Compound of formula (I)	0.5 mg
	Maize Starch	10 mg
	Polyvinylpyrrolidone	2 mg
	Magnesium Stearate	2 mg
	Lactose	to 100 mg

10 Mix together the compound of formula (I), Lactose and Maize Starch. Granulate with a solution of the Polyvinylpyrrolidone dissolved in water. Dry the granules, add the Magnesium Stearate and compress to produce tablets, 100 mg per tablet.

B) Suppository(0.5 mg/product)

15	Compound of formula (I)	25 mg
	Suppository Base (Massa Esterinum C)	to 100 g

Melt the suppository base at 40°C. Gradually incorporate the compound of formula (I) in fine powder form and mix until homogeneous. Pour into suitable moulds, 2 g per mould, and allow to set.

0038046

Massa Esterinum C is a commercially available suppository base consisting of a mixture of mono, di, and tri-glycerides of saturated vegetable fatty acids. It is marketed by Henkel International, Dusseldorf.

5 C) Pessary(0.5mg/product)

Compound of formula (I)	0.5 mg
Lactose	400 mg
Polyvinylpyrrolidone	5 mg
Magnesium Stearate	4.5 mg

10 Mix together the compound of formula (I) and Lactose. Granulate with a solution of Polyvinylpyrrolidone in 50% aqueous ethanol. Dry the granules, add the Magnesium Stearate and compress on suitably shaped punches, 410 mg per pessary.

15 D) Freeze-dried Injection 0.5 mg/vial

Compound of formula (I)	0.5 mg
Mannitol	99.5 mg
Water for Injections to	2.0 ml

20 Dissolve the compound of formula (I) and mannitol in the Water for Injections. Sterilise the solution by passage through a membrane filter, 0.2 μ m pore size, collecting the filtrate in a sterile receiver. Fill into sterile glass vials, 2 ml/vial under aseptic conditions and freeze-dry. Close the vials with sterile rubber closures secured with an aluminium seal.

0038046

The injection is reconstituted prior to administration by the addition of a convenient volume of Water for Injections or sterile saline solution.

CLAIMS

1) Compounds of the general formula

(wherein X is a group capable of functioning as a ligand for a zinc ion;

Ph is a phenyl group which is optionally substituted by one or more substituents selected from halo and nitro radicals;

Y is a group of formula:-

where

R¹ is hydrogen or methyl;

R² is alkyl of 1 to 3 carbon atoms or is methylthiomethyl; and

Z is a group of formula -OR³ or -NR⁴R⁵ where R³, R⁴ and R⁵ are each hydrogen or alkyl of 1 to 4 carbon atoms and R³ can further be phenylalkyl having 1 to 3 carbon atoms in the alkylene moiety thereof, or phenyl) and pharmacologically acceptable basic salts thereof.

2) Compounds as claimed in claim 1 wherein X represents carboxyl.

3) Compounds as claimed in claim 1 wherein X represents mercapto or alkanoylthio having 2 to 5 carbon atoms.

4) Compounds as claimed in any of the preceding claims wherein Ph is unsubstituted phenyl.

5) Compounds as claimed in any of the preceding claims wherein Y is a group of formula

(in either the D- or L-configuration).

6) Compounds as claimed in any of claims 1 to 4 wherein Y is a group of formula:-

10 (in either the D- or L-configuration).

7) Compounds as claimed in any of the preceding claims wherein Z is a group of formula -OH or -NH₂.

8) A process for the preparation of a compound of formula I (as defined in claim 1) or a pharmacologically acceptable basic salt thereof which comprises reacting a compound of formula

(wherein Ph is as defined in claim 1; X¹ is a group X (as defined in claim 1) or a functionally protected derivative thereof;

Q is carboxyl or a functionally activated derivative thereof; and Q^1 and Q^2 are both hydrogen or together form a bond) with a compound of formula

(wherein Y is as defined in claim 1; and Z^1 is a group Z (as defined in claim 1) or a functionally protected derivative thereof); followed (when Q^1 and Q^2 together form a bond) by selective reduction of the said bond and, as appropriate, by deprotection of the product into the compound of formula (I) or pharmacologically acceptable basic salt thereof.

9) Pharmaceutical formulations comprising a therapeutically effective amount of a compound of formula I (as defined in claim 1) or a pharmacologically acceptable basic salt thereof together with an acceptable carrier therefor.

10) Formulations as claimed in claim 9 adapted for oral, rectal, nasal, topical, vaginal or parenteral administration.

11) Formulations as claimed in claim 10 in the form of tablets, capsules, cachets or injectable solutions or suspensions.

12) Compounds of formula I (as defined in claim 1) and pharmacologically basic salts thereof, for use in the therapeutic treatment of a mammal.

13) Compounds of formula I (as defined in claim 1) and pharmacologically basic salts thereof, for use in the

therapeutic treatment of a human.

14) Compounds of formula I (as defined in claim 1) and pharmacologically basic salts thereof, for use in the prolongation and/or potentiation in a mammal of the effects of ~~endogenous~~-enkephalins.

5 15) Compounds of formula I (as defined in claim 1) and pharmacologically basic salts thereof, for use in the treatment of a mammal for a condition where an agent with a morphine-like effect is indicated.
